

## Documentation - Level 5

How to perform an SQL injection using a general truth?

To perform an SQL injection when only one field is available, the operator **OR** followed by a general truth can be used.

```
SELECT * FROM table WHERE username = 'admin' AND password = '$password'
```

```
SELECT * FROM table WHERE username = 'admin' AND password = 'password' OR ... --'
```

Examples of general truths :

- 1=1
- 2=2
- 1<2
- 2>1
- ...
