

Documentation - Level 6

What is a table?

A table in programming is a way to store information like usernames, passwords, emails, etc.

How to obtain the contents of a table with an SQL injection?

When an SQL query is used to display data, the **UNION** operator can be used with SQL injection to send a second query and display data from another table.

```
SELECT * FROM table WHERE username = '$username'
```

```
SELECT * FROM table WHERE username = 'username' UNION SELECT ... --'
```
